Payment screenshot checklist: 9 checks before you confirm an order

For bKash, Nagad and bank-transfer payments sent as screenshots.

Use this list each time a customer sends a payment screenshot. **Checks 1–6 and 9 can be automated**; checks 7 and 8 stay with a person. Automation reads the screenshot and matches it to your own order records — it doesn't log in to your payment accounts and doesn't move money.

- [ ] **1 The amount matches the order total exactly**

  Partial payments and "I'll send the rest later" are the most common mismatch.

CLOSE IT BY HAND	CLOSE IT WITH AUTOMATION
Compare the amount on the screenshot with the order total, including delivery charge.	Designed to read the amount from the screenshot and compare it with the order record.

- [ ] **2 The transaction ID (TrxID) or reference is visible and readable**

  Without it you can't trace the payment later, or spot a reused screenshot.

CLOSE IT BY HAND	CLOSE IT WITH AUTOMATION
Ask for a clearer screenshot if the TrxID is cut off or blurry.	Unreadable screenshots are marked and sent to a person. Nothing is approved that couldn't be read.

- [ ] **3 That reference hasn't been used before**

  A reused screenshot looks perfect. The only way to catch it is to check the reference against past orders.

CLOSE IT BY HAND	CLOSE IT WITH AUTOMATION
Keep a log of each TrxID you've accepted and search it before confirming.	Designed to check each reference against your log and flag repeats for a person.

- [ ] **4 The payment went to your number or account**

  Customers sometimes pay the wrong number; edited screenshots sometimes change it.

CLOSE IT BY HAND	CLOSE IT WITH AUTOMATION
Check the receiving number or account on the screenshot against yours.	Designed to compare the receiving number with the ones you list as yours.

- [ ] **5 The date and time are after the order was placed**

  An old screenshot from a previous purchase can be sent again for a new order.

CLOSE IT BY HAND	CLOSE IT WITH AUTOMATION
Check the payment time against the order time.	Designed to compare timestamps and flag payments made before the order.

- [ ] **6 The sender matches the customer**

  A screenshot from someone else's payment is a warning sign.

CLOSE IT BY HAND	CLOSE IT WITH AUTOMATION
Compare the sender number with the customer's number or the note they gave.	Designed to compare sender details and flag a mismatch.

7 The screenshot doesn't look cropped or edited

Missing status bars, uneven fonts or odd spacing can mean an edited image.

CLOSE IT BY HAND
Ask for the full, uncropped screenshot when anything looks off.

CLOSE IT WITH AUTOMATION
Suspicious images go to a person. This check stays a human judgement.

8 Above your limit, the money is confirmed in your statement

A screenshot shows that a payment was made, not that the money arrived.

CLOSE IT BY HAND
Set an amount limit; above it, check your bKash, Nagad or bank statement before shipping.

CLOSE IT WITH AUTOMATION
Orders above your limit are held for a person to reconcile with the statement.

9 The customer gets a written confirmation and the order is marked paid

Without a record, disputes become your word against theirs.

CLOSE IT BY HAND
Reply with the order number and TrxID, and mark the order paid in your sheet.

CLOSE IT WITH AUTOMATION
Designed to confirm or reject the customer on WhatsApp and update the order record.

A screenshot check confirms the details are consistent with an order and that the reference hasn't been used before. It can't prove money arrived. For that, reconcile with your merchant statement or keep manual approval above an amount you choose.

How many orders do you check this way each day?

Under 10	Keep checking by hand with this list and a TrxID log.
10–50	Automating checks 1–6 and 9 is designed to take most of the routine work off your team.
More than 50	Add order and delivery updates on WhatsApp, and a daily report of flagged payments.

Checking payments by hand each day?

Book a free 30-minute consultation. Show us how payments are checked today, and we'll tell you honestly whether automation makes sense yet.
